

# SEPAC – SIEMENS PROJECT

## A NEW SUCCESS STORY

SEPAC's new success - The first phase of the SIEMENS project, two Excitation Systems (6000 Amp.) belonging to CFE, Manzanillo II, was completed and delivered. With tremendous effort and dedication we satisfied the needs of our client. The client was enormously impressed with the speed at which these equipments were completed, saying how grateful they were that SEPAC was able to finish by the the contracted date (September 24). This is testimony of the high quality engineering present in SEPAC.

These Modern Excitation Systems are equipped with the most advanced technology, incorporating innovative means of communication and control. This again is proof to the market that we at SEPAC are comitted to a constant equipment evolution. Our new technology are currently working efficiently and reliably in CFE ,PEMEX, LYF, and in Central and South America.

In this project SEPAC and SIEMENS joined efforts and experiences to satisfy the demands of modernization and efficiency requested by CFE.

We are proud to announce to our customers:

*"MISSION ACCOMPLISHED"*

The entire project includes the manufacturing of four Excitation Systems for CFE's Manzanillo II and Villa de Reyes.

Both plants require s Excitation Systems capable of controlling four 350 MW Generators. The first two systems were already delivered and the second two are currently being manufactured.

The Systems for Villa de Reyes will be delivered by the end of November 2004 (9000 Amps), this equipment will be one of the largest in Mexico.

These equipments were manufactured under strict quality norms, adhering to all necessary standards and were evaluated by the CFE Laboratory "LAPEM". This evaluation was done during the factory acceptance test conducted in our plant.

For SEPAC, it is a pleasure to present to the industry this new generation of Excitation Systems.
