

# SEPAC DELIVERS NEW ORDER FOR UNITED STATES OF AMERICA

## TACOMA PROJECT : RAV 1111 1P 550K/260

SEPAC CORP., receive at the begining of this year the order for supplying a hydroelectric power plant for TACOMA ELECTRIC at the north of Seattle, Washington.

Jointly with local partner Becwith Electric, a well-established USA protection manufacturer, SEPAC supplied the excitation system for the generator of Mayfield Power Plant.

The excitation system will be on line in summer 2004, and will cover the demand for power of approx. 135,000 households.

The Cowlitz River Project produces hydroelectric power from the water stored behind Mayfield and Mossyrock dams. Built in 1963, Mayfield Dam forms 13-mile-long Mayfield Lake. Mossyrock Dam, built in 1968, stands 606 feet above bedrock and is the tallest dam in Washington State. The dam forms 23.5-mile-long Riffe Lake.

According to the contract, SEPAC supplied the excitation system for 47 MW. The scope of supply also includes the start up, field training and witness testing.

Luis Lechevalier, member of the SEPAC managing board, commented on the new delivery, "Since 1984, SEPAC has supplied excitation systems and power plant equipment for more than 60 power plants in México and Central and South America. This new projects will enable SEPAC to established its position as a competent and experienced beckwith partner for sustainable solutions in UNITED STATES."

For more than 90 years, Tacoma Power has owned and operated hydroelectric projects. About half of the energy used by Tacoma Power's customers is generated from seven dams and powerhouses located on four different rivers in Western Washington.

**Tacoma Power's largest electricity generating Facility is the Cowlitz River Project.** About 2 billion kilowatt-hours of renewable, hydroelectric energy is produced each year, enough energy to serve over 135,000 Northwest homes.
