

RECORD ACHIEVED IN THE MANUFACTURING OF PUERTO LIBERTAD AVR

WE UNDERSTAND OUR COMMITMENT TOWARDS THE CUSTOMER

Not only it was a particular short-time manufacturing challenge for a project of such magnitude, but also for the special conditions of the equipment architecture, as well as for the technical features required by the user.

To conclude the project on time, under the constant CFE supervision during the engineering and manufacturing steps, a key plan was established based on a special project oriented organization involving all the available resources of the company : engineering, production, supplying, testing and financial areas.

Once again, SERPRO demonstrates having the technical and financial capacity to accept any challenge, no matter how difficult it is.

SERPRO established a new record in manufacturing and testing a complete excitation system for Puerto Libertad Thermoelectric Plant at Sonora, Mexico.

For this project, CFE established a delivery time of 30 calendar days.

The challenge of this particular project strengthened the commitment we have with our customers' expectations, by understanding their needs, taking part in their own challenges, and assuming their responsibilities as ours.

The project was an Automatic Voltage Regulator, for a 158 MW machine.
